                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel phosphatase polypeptide, exhibiting substrate-specificity for not less than 15C prenylphosphoric acid. The polynucleotides and encoded polypeptides are applicable in mass-production of all-trans-prenyl alcohols. The sequence represents a rat phosphatase polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ohto C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

              27-FEB-2003
The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a agent to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the regulates the activity of one or more of the regulates the activity of one or more of the regulates the activity of one or more of the regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating to pain and a pharmaceutical composition comprising the one or more of pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating than eggenetal and spared nerve injury (CNI) and spared nerve injury (SNI) in an animal (e.g. spinle or introposition comprision) the sequence data for this patent did not form part of the printed the specification, but was obtained in electronic form directly from WIPO at Epp. who.int/pub/published_pot_engered.
                                                                                                                                                                                                   New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                        Costigan M;
                                                                                                                                                                                                                                                 Claim 1; Page; 1017pp; English.

```

```
The invention discloses a composition comprising two or more isolated rate or human polynuclectides or a polynuclectide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the movel polynuclectide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increases or decreased in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides given in the appropriation and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polypucial or the compound that modulates its activity is useful for preparing a medicament for treating modulates its activity is useful for preparing a medicament for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                  New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        specification, but was obtained in electronic form directly from WIFO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         / Match 60.6%; Score 66; DB 7; Length 282; Local Similarity 50.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     13-MAR-2002
 The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a acray, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound that regulates the activity of one or more of the regulates the expression of a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more compound that expectification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more compound that polymetides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. spinal partined in electronic form directly from wipo at this patent did not form part of the printed specification, but was obtained in electronic form directly from wipo at the sequence presented is a rat protein (shown in Table 2 of the way obtained in electronic form directly from wipo at the protein in the protein for the printed sequence protein for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                               New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      23-AUG-2002
                                                                                                                                                                  15-MAY-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          20-AUG-2002
   The invention relates to novel isolated polypeptides, mature forms of these, or a sequence that is at least 95 * identical to, or having one or more conservative amino acid substitutions in the polypeptides. The conservative amino acid substitutions in the polypeptides. The polypeptides incleaded and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a manufacture of a medicament for treating a syndrome associated with a molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, helminthic, and protozodal), anorexia, cancer, cardiovascular diseases (hypertension, atheroscierosis), neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, epilepsy, immune disorders, asthma, and various dyslipidemias. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, call differentiation, cell proliferation, cell proliferation, cell proliferation, centerapty to nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or hematopoiesis, wound healing and amagiogenesis, in gene therapy, in the presentive medicine, and pharmacogenomics. This sequence turker used as hybridization probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. This sequence typing, preventive and pharmacogenomics. This is sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

```

```
This is the amino acid sequence of human mature phosphatidic acid phosphatase-alpha 1 (PAP-alpha-1), an enzyme that catalyses the conversion of phosphatidic acid into diacylglycerol. 3 Variants of human PAP, i.e. PAP-alpha 1 and its alternatively spliced form PAP-alpha 2 (see AAW79285). PAP-alpha 1 and its alternatively spliced form PAP-alpha 2 (see AAW79285). PAP-beta (see AAW79286) and PAP-gamma (see AAW79287) have been identified. The invention provides PAP polymuclectides (see AAW59086-89) and polypeptides, a method of preparing a PAP polypeptide in transformed host cell, and a method of using PAP to dephosphorylate a substrate, especially lysophosphatidic acid, ceramide 1-phosphate or sphingosine 1-phosphate, particularly for production of diacylglycerol, control the balance of lipid mediators of cellular activation and signal transduction. Sequences that encode PAP are potentially useful, in gene therapy, for treatment of cancer (PAP may be tumour suppressors, PAP-alpha is expressed at lower levels in cancer cells than in normal cells of same tissue type), inflammatory disease and diabetes-associated
                                                                                                               New nucleic acid encoding human phosphatidic acid phosphatases - used to
                                                                                                                                regulate levels of lipid cellular mediators and in gene therapy of e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   54.1%; Score 59; DB 2; 50.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel isolated polypeptides, mature forms of these, or a sequence that is at least 95 % identical to, or having one or more conservative amino acid substitutions in the polypeptides. The polypeptides are useful in the polypeptides, nucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOWX-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, therrosoclerosis), neurodespenerative disorders, Alzheimer's disease, parkinson's disease, epilepsy, immune disorders, asthma, and various trargets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, denatopolesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances to the used as hybridization probes, in chromosome mapping, tissue thereof the antibodial probes, in chromosome mapping, tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                        ö
                                                       phosphatase-alpha 2 (PAP-Alpha-2), amenayment that catalyses the conversion of phosphatidic acid into diacylglycarol. 3 Variants of human PAP-Alpha 2 and its alternatively spliced form PAP-Alpha 1 (see AAW79284), PAP-beta (see AAW79286) and PAP-gamma (see AAW79287) have been identified. The invention provides PAP polymorleotides (see AAW69086-89) and polypeptides, a method of preparing a PAP polymeptide in a transformed host cell, and a method of using PAP to dephosphorylate a bubstrate, especially lysophosphatidic acid, ceramide 1 phosphate or sphingosine 1-phosphate, particularly for production of diacylglycerol, but also monoacylglycerol, ceramide and sphingosine. PAP is able to control the balance of lipid mediators of cellular activation and signal transduction. Sequences that encode PAP may be tumour suppressors, paper therapy, for treatment of cancer (PAP may be tumour suppressors, PAP alpha is expressed at lower levels in cancer cells than in normal cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a human phosphatase designated HPA-1. HPA proteins have anti-HIV, antiallergic and cytostatic activity. HPA antagonists form pharmaceutical compositions for treating or preventing

an immune disorder (e.g. Acquired Immune Deficiency Syndrome (AIDS), Addison's disease and allergies) or cancer (e.g. adenocarcinoma, leukemia and lymphoma). Polynucleotides complementary to polynucleotides encoding HPAs are useful for detecting these sequences in order to diagnose disorders associated with HPA. Neutralizing antibodies against HPA have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of an amino acid sequence selected from PPAP2A, PPAP2B, IHPKI, IHPK3, IHPK3, THPK2, FLJ0503D, D0434014.5, EZF1, Loc127424, Loc113179 and KIAA0826 (ADM72102-ADM72112 respectively). The methods and compositions of the present invention are useful for the diagnosis and/or treatment of neurological diseases or conditions associated with aberrant expression or activity of the Tau-related polypeptide, such as Alzheimer's disease and Parkinson's disease. The present sequence represents a human tau-related polypeptide homologue PPAP2A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   useful for diagnosing and/or treating neurological conditions with aberrant expression of the Tau-related polypeptide, such as Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to tau-related polypeptide consisting essentially

```
The present invention relates to the isolation of human tumour-associated antigenic target (TAT) polynucleotide and polypeptide sequences. Also disclosed is an antibody that binds to a TAT polypeptide. The antibody is a monoclonal antibody. It is not transported a chimeric antibody or a humanised antibody. It is conjugated to a growth inhibitory agent. It is produced in bacteria or in CHO cells and induces death of a cell to which it binds. The antibody is useful for preparing a composition for diagnosing or treating tumours and cancer. The present sequence represents a human TAT polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     54.1%; Score 59; DB 8; 50.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a method of differentially modulating the growth or differentiation of blood endothelial cells (BEC) or lymphatic conductial cells with a composition comprises contexting endothelial cells with a composition comprising an agent that differentially modulates blood or lymphatic endothelial cells. Treating hereditary lymphoedema comprises (dentifying a human subject with lymphoedema and with a mutation in at least one allele of a gene encoding a LEC protein, where the mutation correlates with lymphoedema in human subjects, and with the proviso that the LEC protein is not VEGPT-3; and administering to the subject a composition comprising a lymphatic growth agent selected from VEGP-C or VEGP-D polypeptides and polymoteocides. The invention may be useful for the development of compounds with an antianglogenic, cytostatic, the development of compounds with an antianglogenic, cytostatic, vasotropic or antiinflammatory activity or for gene therapy. The method is useful in modulating the growth or differentiation of blood endothelial cells or lymphoedema, in screening for an endothelial cells, in treating hereditary lymphoedema to the disorder or in monitoring the efficacy or toxicity of a drug on endothelial cells. The agent is useful in manufacturing a medicament for the disorder or in monitoring the efficacy or toxicity of a drug on endothelial cells growth agent may also be used in manufacturing a medicament for the treatment of hereditary lymphoedema resulting from a mutation. The lymphatic growth agent may also be used in manufacturing a medicament for the treatment of hereditary lymphoedema resulting from a mutantial or lymphatic growth agent may also be used in manufacturing a column to fereaditary lymphoedema resulting to essels, such as the treatment of hereditary lymphoedema resulting to essels, such as used or of other diseases and cancer metastasis via the lymphatic column process of the indexer using the source data given in table 14 of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Dahl E,

```
This invention describes novel cytostatic polynucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer or the risk of developing prostatic cancer. Diagnosing is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection substances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of spredetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, short-interfering RNA or ribozymes; an organic molecule of molecular aptamer against the polypeptide; an expense of monoclonal antibody directed against Ab or any of the above derivatised (monoclonal) antibody directed against Ab or any of the above derivatised
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              with a reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polymucleotides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays, between normal and tumorous tissues, with (over)expression being detected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    by quantitative PCR. Analysis of prostatic cancer samples showed that CD24 was upregulated in many of them. Sections of tissue, isolated from prostatic cancer patients, or subjects at risk, were incubated sequentially with anti-human cap murine monoclonal antibodies; biotinylated second antibody; streptavidin-conjugated horseradish peroxidase and then diaminobenzidine as colour former (brown). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Specht T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acids, and encoded proteins, from prostatic cancer tissue, useful for diagnosis, treatment and in screening for specific binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Dahl E, Rosenthal A, Hermann K, Pilarsky C, Spech

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  agents.
                                                              This invention describes novel cytostatic polynucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer. Or the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection ubstances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, abort-interferring RNA or ribozymes; an organic molecule of molecular weight below 5000, preferably 300, that binds to the polypeptide; an aptamer against the polypeptide; a (monoclonal) antibody directed against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polypucleotides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays, by quantitative PCR. Analysis of prostatic cancer samples showed that CD24 was upregulated in many of them. Sections of tissue, isolated from prostatic cancer patients, or subjects at risk, were incubated second antibody; streptavidin-conjugated horseradish prostatic cancer patients, or subjects at risk, were incubated second antibody; streptavidin-conjugated horseradish peroxidase and then diaminobenzidine as colour former (brown). The samples were counterstained with hemalum (blue). Malignant cells stained servance of the supplemental servance of the supplemental servance of the supplemental servance of the supplemental servance of servance of the supplemental servance of servance of the supplemental servance of servance of the supplemental servance of servance of servance of servance of servance of servance of servance of servance of servance of servance of servance of servance of servance of servance of servance of servance of servance of servan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               adenocarcinoma, membrane and cytoplasmic staining was very strong, and lymph node metastases were also stained. ADR65805-ADR66954 represent the polymetide and polypeptide sequences used in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel cytostatic polynucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer or the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection substances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, short-interfering RNA or ribozymes; an organic molecule of molecular weight below 5000, preferably 300, that binds to the polypeptide; an aptamer against the polypeptide; a (monoclonal) antibody (Ab) against the polypeptide, preferably humanised or human; an anti-idiotype, non-human
samples were counterstained with hemalum (blue). Malignant cells stained strongly but non-malignant cells only weakly. In 15 of 63 samples of adenocarcinoma, membrane and cytoplasmic staining was very strong, and lymph node metastases were also stainined. ADR65805-ADR66554 represent the polynucleotide and polypeptide sequences used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pilarsky C, Specht T;

with a reporter group, cell toxin, immunostimulatory molecules and/or radiolostope. The polynucleotides are identified in human prostatic radiolostope. The polynucleotides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays, between normal and tumorous tissues, with (over) expression being detected by quantitative PCR. Analysis of prostatic cancer samples showed that CD24 was upregulated in many of them. Sections of tissue, isolated from prostatic cancer patients, or subjects at risk, were incubated sequentially with anti-human CD4 murine monoclonal antibodies; biotinylated second antibody, streptavidin-conjugated horseradish peroxidase and then diaminobenzidine as colour former (brown). The samples were counterstained with hemalum (blue). Malignant cells stained atrongly but non-malignant cells only weakly. In 15 of 63 samples of adenocarcinoma, membrane and cytoplasmic staining was very strong, and lymph node metastases were also stainined. ADR65805-ADR66954 represent the polymucleotide and polypeptide sequences used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
(monoclonal) antibody directed against Ab or any of the above derivatised
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel cytostatic polynucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Rosenthal A, Hermann K, Pilarsky C, Specht T;

New recombinant DNA construct comprising a promoter positioned to provifor expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

```
cc or the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection substances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, short-interfering RNA or ribozymes; an organic molecule of molecular weight below 8000, preferably 300, that binds to the polypeptide; an organist the polypeptide; an antibody (Ab) against the polypeptide; an intibody directed against Ab or any of the above derivatised (monoclonal) antibody (Ab) against the polypeptide; and antibody directed against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polynucleotides are identified in human prostatic concer by differential expression analysis, using DNA microarrays, between normal and tumorous tissues, with (over) expression being detected by quantitative PCR. Analysis of prostatic cancer samples showed that CCC cancer by differential expression analysis, where incubated from prostatic cancer patients, or subjects at risk, were incubated concertained with hemalum (blue). Malignant cells stained percoxidase and then diaminoberzidine as colour former (brown). The samples were counterstained with hemalum (blue). Malignant cells stained servong and belymented and cytoplasmic staining was very strong, and lymph node metastases were also stained. ADR65054 represent the invariance of polymerial concertions, membrane and cytoplasmic servong in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nvention.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant convention in mproved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the colynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. CC increased resistance to herbicides, extreme semotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modification of carbohydrate, nitrogen or content, improved yield by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress production. This sequence represents a bacterial polypeptide used in the score of the printed specification of the printed specification but was obtained in electronic forms. ö Gape ö Length 847; 45.0%; Score 49; DB 8; Length 847 53.3%; Pred. The invention relates to a non-naturally occurring peptide of Mycobacterium tuberculosis comprising an amino acid sequence corresponding to an anion pump protein. The invention also relates to a non-naturally occurring nucleic acid corresponding to an anion pump protein. The invention also relates to a non-naturally occurring nucleic acid corresponding to a DNA sequence of Mycobacterium tuberculosis or Mycobacterium tuberculosis or Mycobacterium leprae or for screening for new tuberculosis drugs. Purified proteins derived from the sequences of the invention may elicit a specific immune response. The peptide may also be used to detect hypersensitivity reactions of individuals exposed to Mycobacterium tuberculosis or Mycobacterium leprae. The proteins and peptides may be affixed to solid supports to detect antibodies typical of hypersensitivity reactions, from a patient's sera. This sequence represents Mycobacterium tuberculosis non-atturally occurring peptide of the invention. Note: The sequence data for this patent did not format directly from USPTO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polymucleotide encoding a polypoptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant baving an improved property. The plant is a crop plant continue and probability. The plant is a crop plant baving an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the copylynuclectide or polypeptide is useful for improving plants with comprise transformed plant, where the polymuclectide or polypeptide is useful for improving plants with compressed plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme commetic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the content, improved yield by modification of carbohydrate, introgen or phosphorus use and/or update, by modification of photocynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannant condition, improved lignin production or improved galactomannant condition, improved lignin production or improved galactomannant condition. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic correction or improved form part of the printed specification but was obtained in electronic corrections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                       New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABR2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences
                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by a canes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. The acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies perceit from a canes proteins These antibodies and be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by canzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the princed appecification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated polynucleotide (ACF64435-ACF64733)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Maisonneuve JL;

additionally encompasses expression vectors and host cells comprising a diditionally encompasses expression vectors and host cells comprising a polymerical comprising a polymetrial comprising a polymeptide of the invention; a method for stimulating an immune response specific for a P. acnes polymetrial and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polymetrial and insulating the development of P. acnes in a ratigan-presenting cells that express the polymetrial in a method and kit for detecting or determining the presence or absence of P. acnes in a patient. The P. acnes polymetrial that express the proteins, T cell populations or antigen-presenting cells that express the proteins, T cell populations or antigen-presenting cells that express the proteins, T cell populations or antigen-presenting cells that express the proteins, T cell populations or antigen-presenting cells that express the volgaris, or for stimulating an immune response specific for a P. acnes protein. The polymucleotides can also be used as probes or primers for mucleic acid hybridisation. The vaccine composition is useful for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polymucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
   immunogenic fragments of P. acnes polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 84 AA;

New proteinaceous molecule comprising a binding peptide and a core comprising a beta-barrel, useful for preparing a composition for diagnosing or treating a condition involving unwanted proteins, cells or microorganisms e.g., cancer

Example 3; Page 30; 84pp; English.

immunoglobulin superfamily origin) which comprises a binding peptide and a core comprising a beta-barral of at least 4 strands The invention also describes a method for identifying the proteinaceous molecule, The invention also describes a method for identifying the proteinaceous molecule, a method for producing a comprising the isolated proteinaceous molecule, a method for producing a conformation and the proteinaceous molecule capable of displaying at least one desired peptide sequence, displaying a desired peptide sequence, producing a library including artificial binding peptides, sequence, producing a library including artificial binding peptides, comprising the proteinaceous molecule (or treating a pathological condition involving unwanted proteins, cells or microorganisms, a diagnostic assay comprising the isolated proteinaceous molecule, a gene delivery vehicle comprising a nucleic acid encoding the isolated condition and a nucleic acid encoding a gene of interest and a chromatography column comprising the proteinaceous molecule and a packaging material. The alteration of the molecule comprises a post-translational modification. The proteinaceous molecule is useful for translational modification. The proteinaceous molecule is useful for ö preparing a composition for diagnosing or treating a pathological condition involving unwanted proteins, cells or microorganisms, e.g., Gaps ö Query Match 41.3%; Score 45; DB 8; Length 135; Best Local Similarity 53.3%; Pred. Applying cosmetic substance to desired target molecule, involves providing conjugate of proteinaceous substance having specific affinity for target molecule linked to cosmetic substance.

Claim 18; Fig 22; 213pp; English.

The invention relates to a novel method for applying a cosmetic substance to a desired target molecule. The method comprises providing a conjugate

                                                                                                                                                                                                                                                             ö
of a proteinaceous substance having specific affinity for the target molecule linked to a cosmetic substance, where the resulting connection between cosmetic substance and target molecule can be disrupted upon the presence of a chemical and/or physical signal. The invention further comprises: a conjugate obtained by the method; a cosmetic composition comprising the conjugate; a detergent and/or softener composition comprising the conjugate; and a di- or multivalent proteinaceous substance having specific affinity for two or more target molecules present in hair, where epitopes are recognised on two or more target molecules may be the same or different. The method is useful for applying a cosmetic substance to a desired target molecule. The di- or multivalent proteinaceous substance is useful for a perfume, a deodorant, a mouth wash, cleaning, hair dye, a lightick, rouge or another skin colouring composition. This sequence represents a versatile affinity protein (VAP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a serine protease designated BSSP-3, which is isolated from human brain tissue. Transformants may be used to produce the enzyme or its partial sequences. Products from the present invention are used for screening for potential peptide or non-peptide serine protease inhibitors or expression regulators for use as drugs

The present sequence represents human neurotrypsin. Neurotrypsin proteins and polymucleotides can be used: (1) to inhibit tumours, including metastases, eg. of brain or retina; (ii) to minimise tiseue damage caused by stroke or brain injury (having a protective effect on the penumbra zone); (iii) to treat or prevent neurodegeneration, controllammacrory disease (e.g. multiple sclerosis) or epilepsy; (iv) to increase survival of damaged neurons (e.g. in cases of hypoxia, caused increase survival of damaged neurons (e.g. in cases of hypoxia, canonation of synapses; (v) to treat or prevent retinal disorders (e.g. degeneration or neoanglogenesis); (vi) to prevent apoptosis (or other causes of call death) in the nervous system; (vii) to regenerate brain performance, including learning and memory; (ix) to treat or prevent a wide range of psychiatric disorders and (x) to treat or prevent a wide range of psychiatric disorders; and (xi) to treat brain or lung injury associated with protease expression (specifically emphysema or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human and murine neurotrypsin - used, e.g. for inhibiting tumours, treatment of neurological or lung disease, including by gene therapy and in drug development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention describes the use of polypeptides related to urological disorders for identifying a compound capable of treating a urological disorder, identifying a subject having a urological disorder.

or treating a subject having a urological disorder. Also described: (1) a method for identifying a compound capable of treating a urological disorder; (2) a method for identifying a subject having a urological disorder; and (3) a method for treating a subject having a urological disorder. The compound has uropathic and cytostatic activities. The polypeptides related to urological disorders are useful for identifying a compound capable of treating a urological disorder, identifying a subject having a urological disorder. Disorders include urinary incontinence and bening proceducing having a urological disorder include urinary incontinence and bening proceducing hyperplasia. The present sequence represents a human urological disorder related protein, which is used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Use of polypeptides related to urological disorders, e.g. 44390, 54181, 211 or for identifying a compound capable of treating a urological disorder or identifying and treating a subject having a urological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   41.3%; Score 45; DB 8; Length 875

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic sacid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                         soft tissue sarcoma; cytostatic; gene therapy; vaccine; screening; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human polypeptides, termed NOVX, and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for diagnosing disease, and screening for potential therapeutic
tuberous sclerosis; scleroderma; atherosclerosis; infectious disease; obesity; anorexia; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; hematopoietic disorder; haemophilia; hypercoagulation; Crohn's disease; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated NOVX polypeptide useful for treating atherosclerosis, metabolic disorders, diabetes, obesity, infectious disease, anorexia, neurodegenerative disorders, Alzheimer's disease and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; Page 205; 666pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                 polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polymeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention Abm06202-Abm067373 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide or as a probe for useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins Abm03759-Abm06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polynucleotides and polypeptides are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

This invention relates to a method of differentially modulating the growth or differentiation of blood endothelial cells (BEC) or lymphatic condocthelial cells with a composition comprising an agent that differentially modulates blood or lymphatic endothelial cells. Treating hereditary lymphoedema comprises contentially modulates blood or lymphatic endothelial cells. Treating hereditary lymphoedema comprises confentifying a human subject with lymphoedema and with a mutention in at least one allele of a gene encoding a LEC protein, where the mutation content of composition to VEGFP. Dispupped a LEC protein, where the mutation comprises on the LEC protein is not VEGFP. It is not VEGFP. It is not VEGFP. It is not VEGFP. It is not VEGFP. It is not VEGFP. It is not very composition with an antianglogenic, cytosteric, was croppic or antiniflammatory activity or for gene therapy. The method is useful in modulating the growth or differentiation of blood condothelial cells or Imphatic endothelial cells, in treating hereditary lymphoedema, in screening for an endothelial cells in manifecturing a medicament for the differential modulation of blood vessel endothelial cells. The agent is useful in manifecturing a medicament for the differential modulation of blood vessel endothelial cell or lymphatic vessel endothelial cell growth or differentiation. The lymphatic growth agent may also be used in manifacturing a medicament for the treatment of haredigary lymphoedema resulting a medicament for the treatment of haredigary lymphoedema are mitation in a mitation in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the treatment of hereditary lymphoedema resulting from a mutation in a LEC gene or of other diseases involving the lymphatic vessels, such as various inflammatory diseases and cancer metastasis via the lymphatic system. The present sequence is that of a human LEC/BEC differentially expressed protein which is related to the method of the invention. Note: This sequence does not appear in the specification but was obtained by the indexer using the source data given in table 14 of the specification.
lymphatic growth agent, VEGF-C, VEGF-D, antiangiogenic; cytostatic, vasotropic; antiinflammatory, gene therapy; endothelial cell disorder; inflammatory disease; cancer metastasis; lymphatic system; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human transferase proteins useful for preventing, diagnosing and treating cancers and developmental, gastrointestinal, genetic, immunological, neurological, reproductive and smooth muscle disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               claimed novel human transferase proteins of the invention (see AAY79209-23). The sequence was deduced from a CDNA clone (see AAZ94201) isolated from a caecal tissue library. It shows homology to human myristoyl-COA protein N-myristoyltransferase. TRNSFS-1 is expressed in reproductive, nervous and smooth muscle tissues, especially those associated with cancer and inflammation. The new human transferase proteins and the polymolectides encoding them can be used in the diagnosis, prevention and treatment of cancer, developmental disorders, gastrointestinal disorders, genetic disorders, immunological disorders, neurological disorders, reproductive disorders, and smooth muscle disorders. The

The invention relates to a novel isolated mucleic acid and the PRO
coplypeptide encoded by it. A protein of the invention has
antiniflammatory, antidarchiric, antihematic, immunosuppressive,
costeopathic, antidabetic, dermatological, antipsoriatic, antiallergic,
antiasthmatic, hepatotropic, and respiratory activity. A polymucleotide
cof the invention may have a use in gene therapy. The PRO polypeptide, its
adonist, antagonist, or antibody that specifically binds to the
cof the invention may have a use in gene therapy. The PRO polypeptide, its
agonist, antagonist, or antibody that specifically binds to the
cof yestemic lupus erythematosus, rheumatoid arthritis, osteoarthritis,
coplypeptide is useful for treating an immune related disorder such as
systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis,

Wood WI;

New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

Claim 1; SEQ ID NO 13176; 122pp; English.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant baving an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant with the cacombinant DNA construct and growing the transformed plant where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plants with construct is useful for improving plants with construct is useful for producing plants with construct is useful for producing plants with construct or plant properties, e.g. improved cold, heat or a drought tolerance, colerance to herbicides extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of carbohydrate, introgen or homologous recombination, modified seamon of carbohydrate, introgen or phosphorus use and/or uptake, by modification of fabotosynthesis or by providing improved plant growth and development under at least one stress condition, improved light plant growth and development under at least one stress condition, improved light or uptake, by modification of improved galactomannan providing now Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic form track the minuted specification but was obtained in electronic form track the minute properties and provide and provide and the printed specification but was obtained in electronic form to the printed specification but was obtained in electronic constitution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to the isolation of novel mammalian kinases designated melanoma alpha-kinase (MK), heart alpha-kinase (HK), kidney alpha-kinase (KK), akeletal muscle alpha-kinase (KK), and lymphocyte alpha-kinase (LK), and the polynucleotide sequences encoding them. The domains, one being an alpha-kinase proteins are characterised by the presence of at least two domains, one being an alpha-kinase catalytic domain and other being an ion channel domain. The proteins are useful for treating an animal in need of increased activity of melanoma, kidney, heart, skeletal muscle or detecting the presence of an antibody to the kinase is useful for detecting the presence of an antibody with kinase is useful for alpha-kinase in a sample. ABU62065-ABU62072 represent the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel mammalian alpha-kinase proteins, including melanoma, kidney, heart, skeletal muscle or lymphocyte alpha-kinase protein useful for treating an animal in need of increased activity of mammalian alpha-kinase.

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed conditions are therapy techniques to restore normal cativity of (II) is useful in gene therapy techniques to restore normal cativity of (II) it) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites absermant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in collypeptide and polynucleotide sequences have applications in the protein dependent on DNA and and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

Novel polypeptides and nucleic acids obtained from cDNA libraries prepared from various human tissues, for diagnosis and treatment of cancer, neurological, inflammatory, and autoimmune disorders.

Example 2; SEQ ID NO 610; 107pp; English.

The invention relates to novel isolated human secreted polypeptides (1) and (11) are useful for treating and polymucleotides (11). (1) and (11) are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's disease, ischaemia-repertusion injury, shock, sepais, immune responses, and is involved in increasing haematopoiesis, stem cell survival, bone growth and remodeling. (1), (11) and modulators of (11) is a lso useful for prophylaxis or treatment of one or more cancers. (11) is also useful for creating transgenic animals useful for studying the in vivo activities of the polypeptide as well as for studying modulators of the polypeptides. (1) induces the proliferation of neural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and mobilities. In addition, (1) is involved in chemotractic or chemokines. CC Parkinson's disease, Huntington's disease, and amyotrophic lateral schronism. In addition, (1) is involved in chemotractic or chemokines. CC activity, regulation of hementopoiesis and is useful for treating myeloid activity, regulation of home, cartilage, tendon, liagment and/or nerve tissue growth, and in tissue repair, healing of burns, incisions, ulcers, for treating osteoporosis, osteoarthritis, bone degenerative disorders, or periodontal disease. Furthermore, (1) is also useful for gut treating osteoporosis, osteoarthritis, bone degenerative disorders, creating osteoporosis, osteoarthritis, home degenerative disorders, reperfusion injury in various tissues, various immune deficiencies and clusque in infections, autoimmune disorders e.g. multiple sclerosis, creations and conditions such as asthma or other respiratory problems. In addition, (1) affects biorhythms or circadian cycles of rhythms, creations and conditions, such as asthma or other respiratory problems. CC dietary fat, lippid, protein, carbohydrate, vitamins, miners and managesic effects or other pain reducing effects immune response. Aduly8020-AAU28915 represent novel human secreted

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               inflammatory, haematopoietic, immune, neurodegenerative or stem cell disorders, such as aplastic anaemia or cancer, as well as for promoting wound healing. The molecules may also be utilised during gene therapy procedures. The current sequence is that of a human therapeutic contig protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                    antiinflammatory; neuroprotective; antianaemic; cytostatic; vulnerary; inflammatory; haematopoiesis; immunity; neurodegenerative; stem cell; aplastic anaemia; cancer; wound healing; gene therapy.

          This invention relates to a novel method for altering one or more plant characteristics. Specifically, it refers to identifying genes that are up characteristics. Specifically, it refers to identifying genes that are up characteristics are rebaidopsis and using these sequences to alter plant characteristics accordingly. The present invention describes generating transgenic plants for the production of growth regulators, canzymes, therapeutics, pharmaceuticals and animal feed products, where the altered plant characteristics are selected from increased yield or blomass, enhanced survival capacity, stress tolerance, plant architecture or physiology, altered endoratedulication, biochemistry, signal transduction, storage lipid mobilisation and/or altered photosynthesis, each relative to the corresponding wild type plants. Accordingly, these each relative to the corresponding wild type plants. Accordingly, these denders also be useful as positive or negative selectable markers during transformation of cells or tissues. The identified genes play a cole in a variety of biological processes such as DNA replication, cell caranteristic and factors. This polypeptide sequence is thale cress protein expressed by a gene upregulated 1.3 fold or more in plants overexpressing the EZFADPa transcription factor, given in an exemplification of the

RESULT 49

```
The invention relates to an isolated NOVX polypeptide (of 44 disclosed) comprising its mature form, a sequence having at least 95% sequence identity to NOVX or a sequence comprising one or more conservative substitutions in the amino acid sequence of NOVX. Also included are a composition comprising NOVX and a carrier, a kit comprising, in one or concentrate, the composition, a method of identifying an agent that binds to NOVX, a method for identifying a potential therapeutic agent for abstrant physiclogical interactions of NOVX, a method for screening for a method of treating or preventing a pathology associated with NOVX, a method of preating a pathology associated with NOVX, a method of preating or preventing a pathology associated with NOVX or a pathological state in a mammal, an isolated nucleic acid molecule, a cell comprising the vector, an antibody that immunospecifically binds to NOVX, a method for determining the presence or amount of NOVX or the nucleic acid molecule in a sample, a method for determining the presence of or predisposition to a disease associated with altered levels of expression of NOVX or the nucleic acid molecule in a sample, an ethod for determining the presence of or predisposition to a disease associated with altered levels of expression of NOVX or the nucleic acid molecule in a sample, an enthod for determining the presence of or predisposition to a disease associated with nucleic acid molecules are useful in disease, stroke, allergies, parkinson's disease, Alahimier or preventing diseases or conditions, e.g. autoimmune disease, Alahimier's disease, multiple sclerosis, anxiety, plain, diabetes, graft versus host disease, parterial and parasitic infections (maltipon, e.g. autoimmune disease, parterial and parasitic infections (maltipon, e.g. autoimmune disease, parterial and parasitic infections (many more diseases and diseases and diseases and diseases and diseases.)

Paresitication). The present sequence or supererial and disease and diseases and diseases and diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 421 AA;

New NOVX polypeptides and polynucleotides, useful in diagnosing, treating or preventing diseases or conditions, e.g. autoimmune disease, Alzheimer's disease, diabetes, graft versus host disease, cancer or viral or bacterial infections.

Claim 2, SEQ ID NO 10; 342pp; English.

The invention relates to an isolated NoVX polypeptide (of 44 disclosed) comprising its mature form, a sequence having at least 95% sequence (definity to NOVX or a sequence comprising one or more conservative substitutions in the amino acid sequence of NOVX. Also included are a composition comprising NOVX and a carrier, a kit comprising, in one or composition comprising NOVX and a carrier, a kit comprising, in one or concentancers, the composition, a method of identifying an agent that thinks to NOVX, a method for identifying an agent for composition of a pathology related to aberrant expression or comprising lineractions of NOVX, a method for screening for a medulator of activity of or of latency or predisposition to a pathology associated with NOVX, a method for modulating the activity of NOVX, a completed of treating or preventing a pathology associated with NOVX or a pathological state in a mammal, an isolated nucleic acid molecule or pathological state in a mammal, an isolated nucleic acid molecule or or preventing the presence or amount of NOVX or the nucleic acid molecule in a sample, a method for determining the presence or amount of NOVX or the nucleic acid molecule in a sample, a method for determining the presence of or predisposition to a disease associated with altered levels of expression of NOVX or the nucleic acid molecule in a family more conditions that lead to expression of the polypeptide). NOVX is useful in the menufacture of a medicament for treating a syndrome associated with a human disease associated with NOVX. The polypeptides and nucleic acid molecules are useful in diagnosing, treating or conditions, e.g. autoimmume disease, Huntington's disease, Huntington's disease, multiple sclerosis, anxiety, pain, disease, yarfet versus host disease, conditions, anaemia, cancer, viral or bacterial and

parasitic infections (many more diseases and disorders are listed in the specification). The present sequence represents a NOVX protein. ខ្លួន្តបូប

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 32, Application US/10812238A

Sequence 32, Application US/10812238A

Sequence 32, Application US/20050002904A1

GENERAL INFORMATION:
APPLICANT: Wary, Kishore, K.
APPLICANT: Huntsoe, Joseph O.
TITLE OF INVENTION: and Type I Collagen Inducible Protein (VCIP)
FILE REFERENCE: D6563
CURRENT APPLICATION NUMBER: US/10/812,238A

CURRENT FILING DATE: 2004-03-29

PRIOR APPLICATION NUMBER: US 60/458,164

PRIOR FILING DATE: 2003-03-27

NUMBER OF SEQ ID NOS: 36

LENGTH: 6
